Believing Galileo

Galileo's conflict with the Catholic Church in the early seventeenth century is often presented as a clash between evidence-based scientific observation and stubborn adherence to religious doctrine. Textbooks describe how Galileo's observations of the orbiting moons of Jupiter demonstrated there are objects that do not orbit Earth, making the Catholic Church's insistence that all heavenly bodies were circling Earth appear irrational.

The Copernican system, which was developed in the early 1500s by Nicolaus Copernicus and advocated by Galileo, held that Earth and other planets circled the sun. However, objections had quickly been raised against this theory. For instance, it (26) a phenomenon known as parallax. Critics in the church argued that, just as one's thumb held up at arm's length seems to move from side to side when viewed through one eye and then the other, if Earth really were traveling around the sun, the position of a star would appear to change when viewed from opposite sides of the sun. As no such change could be detected in Galileo's day, the Copernican theory seemed deeply flawed.

Most of Galileo's contemporaries, including prominent members of the church, actually believed in another theory. This was known as the Tychonic system, and it was (27). Developed by Danish astronomer Tycho Brahe, it satisfied the church by proposing that Earth was the center of the universe and the sun orbited it. However, it also stated that the moon, stars, and other celestial objects all orbited the sun. This hybrid theory was consistent with much of Galileo's astronomical evidence as well.

Some scholars even say that, in Galileo's day, the Copernican theory (28). Philosopher Paul Feyerabend, for example, argued that while many astronomical observations undermined belief in the idea that everything revolved around Earth, the Copernican system was on even shakier ground in terms of evidence. For example, if Earth were moving around the sun, why did birds that were flying through the air not get left behind? It took decades before the weight of scientific evidence accumulated sufficiently to convince the majority of astronomers that Galileo had been correct.

Humanized Mascots

In marketing, companies frequently use anthropomorphism—the practice of giving animals or inanimate objects human characteristics—to promote their brands. Examples of such anthropomorphic mascots include sponges, raisins, and candy-covered chocolates, depicted with appealing faces and humanlike limbs. The creation of such mascots, it has long been presumed, will encourage consumers to forge a personal or emotional connection with the brand. This has been shown to attract buyers to a specific product and encourage brand loyalty.

A recent study has revealed that (29). Marina Puzakova, an assistant professor of marketing at Lehigh University in the United States, and her colleagues conducted experiments in which participants were familiarized with products both with and without anthropomorphized mascots. They were then shown news reports about how the products had failed in some way, such as by not living up to their advertised claims. The participants' reactions were significantly more negative when products with humanized mascots performed unsuccessfully. According to Puzakova, consumers feel such products (30). She says this notion “can be extremely strong,” with consumers developing “negative sentiments toward the brand,” as if, for example, the humanlike chocolates in an advertisement had intentionally let down the brand's customers by not satisfying their taste buds.

Another study by Puzakova showed that brand humanization also has important implications for perceptions of price fairness. In particular, it suggested companies should clearly communicate that (31) price increases. In the study, household products in six different categories were independently categorized as humanized or nonhumanized. Shoppers in the states of Wisconsin and Massachusetts were then asked how they would respond if the prices of those products were either raised or lowered. Results revealed a heightened sensitivity to price in brands with anthropomorphized mascots; demand was reduced when prices rose, and increased when prices fell, to a much greater extent with those brands. Puzakova believes that this is because customers are less likely to attribute price increases to impersonal market forces, and more likely to put the blame on a brand's humanlike mascot.

Incarceration in the United States

Although the United States accounts for just 5 percent of the world's population, it holds nearly a quarter of the world's prisoners. With around 2.2 million inmates, it incarcerates more of its citizens than any other nation. This statistic becomes even more astonishing in light of the fact that during the 1970s, there were only about 300,000 prisoners in the U.S. penal system. The rise has left correctional facilities bursting at the seams, drained the nation financially, and drawn intense criticism internationally.

Media coverage commonly ascribes the growth of incarceration rates to a crackdown on illegal narcotics by federal authorities. Stricter federal drug laws in the 1980s saw the start of a dramatic increase in the number of citizens imprisoned for drug-related offenses, as prison terms began to be imposed not only on dealers of highly addictive drugs such as heroin but also on those possessing small quantities of softer drugs. Statistics appear to confirm the widely accepted theory: the proportion of inmates in federal prisons for narcotics-related offenses went from 16 percent in 1980 to over 50 percent in 2012. Though drug use has not risen appreciably, the United States has been locking up many more drug users.

Federal prison inmates—those convicted of federal crimes such as drug trafficking or interstate fraud—account for only about 10 percent of the nation's total, however. The overwhelming majority of the country's inmates are housed in state prisons, where the ranks of prisoners convicted for non-drug offenses such as property crimes and assault have far outstripped the number of drug offenders. Admittedly, the overall crime rate did rise from the 1960s to the early 1990s, which resulted in more offenders being incarcerated. But then it began to fall, even as the number of inmates in both federal and state prisons exploded.

John Pfaff of Fordham Law School in New York lays the blame for the expansion of the prison population on prosecutors. These officials decide whether a crime should be handled as a felony—punishable by more than a year in prison in most states—or as a misdemeanor, which is generally subject to a fine or a short sentence. Since the mid-1990s, average sentence lengths have remained stable, yet increases in the rate at which prosecutors have been filing felony charges against people accused of crimes such as vandalism and theft, which may be charged as misdemeanors when circumstances warrant, have shown a strong correlation with the growth in the prison population.

Academics like Pfaff hypothesize that prosecutors feel taking a tough-on-crime stance will help them advance professionally. “For a long time, prosecutors have defined themselves through conviction rates and winning the big cases with the big sentences,” says Nicholas Turner, president of the Vera Institute of Justice, a research and policy group based in New York City. “But the evidence is certainly tipping that the attainment of safety and justice requires more than just putting people in prison for a long time.” Options such as alternatives to incarceration, as well as providing guidelines and oversight to prevent the abuse of prosecutorial power, need to be examined as potential solutions to the nation's overcrowded prisons.

(32) According to the media, the rise in the U.S. prison population can mainly be attributed to the fact that

- 1 a sudden rise in the number of people using dangerous drugs led to a public outcry for harsher sentences for drug trafficking.
- 2 new research demonstrating the effectiveness of imprisonment led to calls for more severe punishment for drug convictions in general.
- 3 improvements in policing techniques allowed authorities to arrest a greater number of both drug users and drug dealers.
- 4 changes in government policy led to the imprisonment of drug users who would not previously have received prison sentences.

(33) What does the author of the passage imply about the increase in prisoners who have been convicted of drug offenses?

- 1 The increase in the number of drug offenders in federal prisons has not had a significant effect on the growth of the U.S. prison population as a whole.
- 2 Efforts to expand state prisons have helped to remove some of the burden from federally operated prisons crowded with drug offenders.
- 3 The decline in inmates in state prisons for drug offenses has been less significant than the dramatic rise in federally convicted drug offenders.
- 4 State governments' enthusiasm for imprisoning drug offenders appears to have had a major influence on federal drug-sentencing policies.

(34) What does John Pfaff believe is the main reason more people have been sentenced to prison in recent years?

- 1 Hoping to further their careers, prosecutors are tending to be more aggressive in their handling of criminal cases.
- 2 In an effort to win elections, politicians have been putting pressure on prosecutors to raise their conviction rates.
- 3 The failure of programs designed to provide alternatives to prisons has left prosecutors no choice but to push for more prison sentences.
- 4 The federal government has urged prosecutors to seek longer prison terms as a possible solution to address the nation's drug problem.

The Origin of Modern Britons

For generations, students of British history have been taught that the Celts, a warlike yet culturally advanced ethnic group, were Britain's indigenous people, having migrated from central Europe to populate present-day England and the rest of the British Isles during the Iron Age, around 400 BC. The Celts were subsequently overrun by a series of invaders in the fourth and fifth centuries AD, most notably the Angles, Saxons, and Jutes—Germanic tribes from whom the modern population of England is said to be descended. According to traditional accounts, Celtic inhabitants remained in areas such as Ireland, Wales, and Scotland, but were wiped out by the Anglo-Saxons in England, and the Celts' lyrical language, rich culture, and traditional lifestyle were lost there as well. This narrative has informed the identity of modern people in the British Isles, with the Scottish, Welsh, and Irish considering themselves ethnically as well as culturally distinct from the English.

Recent scholarship and DNA research, however, have cast doubt on this version of British history. Stephen Oppenheimer, a medical geneticist at Oxford University, found that the vast majority of native Britons, including the Scottish, Welsh, and Irish, have DNA which indicates they are in fact descended from hunter-gatherers who lived in the area of the modern-day Basque Country in Spain at the end of the Ice Age. Celtic DNA, in contrast, comprises less than 10 percent of the total genetic makeup of the male population in the British Isles. According to Oppenheimer, the original inhabitants of Britain spoke not a Celtic language, but one related to the Basque tongue, and migrated along the Atlantic coast to Britain between 15,000 and 7,500 years ago. Oppenheimer believes Celtic languages originated in Anatolia (modern-day Turkey) and were most likely introduced, along with agricultural practices, via subsequent Celtic migrations along the north coast of the Mediterranean and then to Britain via France about 6,000 years ago, during the Neolithic Period.

The account of the virtual annihilation of England's indigenous Celtic peoples by Anglo-Saxon tribes is also contradicted by both linguistic and genetic evidence. In other nations whose indigenous populations were nearly wiped out and replaced by invading peoples, such as Australia and the United States, many place-names in the language of the original inhabitants have endured to this day. But in England, as Oppenheimer points out, very few places and geographical features bear Celtic names, and the language contains just a handful of Celtic terms. Moreover, genetic studies of modern Britons show that, far from predominating the English gene pool, the Anglo-Saxons barely made a splash. In fact, even the Vikings, who are generally portrayed in the history books as raiders rather than conquerors, have a larger genetic presence in modern-day Britain than the Angles, Saxons, and Jutes do. Rather, the Anglo-Saxon invasions seem to have occurred at the elite level, displacing rulers but leaving resident populations intact. "Based on the overall genetic perspective of the British," says Oppenheimer, "it seems that Celts, Belgians, Angles, Jutes, Saxons, Vikings and Normans were all immigrant minorities compared with the Basque pioneers."

(35) According to the author of the passage, how has the traditional historic account of the settling of Britain influenced the attitude of people in the British Isles?

- 1 Britons have taken pride in the fact that the Celts established their superiority over earlier inhabitants by conquering Britain during the Iron Age.
- 2 Other people of the British Isles have come to resent the English for their efforts to repress Celtic influence throughout Britain over many centuries.
- 3 The repeated invasions of the islands by different groups have resulted in a cultural diversity that all Britons consider important to their identity.
- 4 The belief that they have a distinct ancestry has caused some people of the British Isles to emphasize cultural differences between themselves and the English.

(36) Stephen Oppenheimer believes that the Celts

- 1 both arrived later and had a substantially less significant impact on the British gene pool than the Basque settlers did.
- 2 were so similar genetically to the modern-day Basque people that the two groups can only be distinguished based on culture and language.
- 3 gradually pushed out the indigenous peoples of England by replacing the hunter-gatherer lifestyle with agriculture.
- 4 were clearly overwhelmed and largely displaced by incoming migrations from the European mainland during the Neolithic Period.

(37) What does the evidence indicate about the Anglo-Saxon invasions of the British Isles?

- 1 The Celts may have been forced to ally themselves with the Vikings in an effort to resist the attacks of the Anglo-Saxons.
- 2 The relative absence of Celtic place names today suggests the Anglo-Saxons actively sought to wipe out Celtic culture.
- 3 The idea that the Anglo-Saxons largely eliminated the native Celtic population from England is not accurate.
- 4 The similarity of Celtic culture to that of the Anglo-Saxons shows the groups had interacted extensively before the invasions.

Interpreting the U.S. Constitution

The United States Constitution is the cornerstone of American democracy. It lays out the rights of U.S. citizens and the principles by which the nation is to be governed, and has been used since the early 1800s by the Supreme Court to evaluate the validity of laws passed by all levels of government. Applying this eighteenth-century document to the intricate issues of modern society, however, can be a truly daunting task.

When it comes to the Supreme Court's relationship with the Constitution, experts are divided into two main camps. Proponents of the "living Constitution" principle contend that the language, which is frequently both general and vague, was intentionally written that way to enable succeeding generations of judges to deal with issues that the nation's eighteenth-century founders could never have foreseen. They say that it is only by

allowing the Supreme Court to apply modern values and ideas to the Constitution that the document can remain a valid foundation for the American legal system in the twenty-first century. Without judicial interpretation of the Constitution, the idea's defenders say, the courts would come to a standstill, and the Constitution would deteriorate into an irrelevant relic. They further argue that since such a high degree of political consensus is required to amend the Constitution, the living Constitution principle is the only sensible option.

Proponents of "Originalism," on the other hand, believe the Supreme Court must evaluate the validity of laws passed by the government based on the principles laid out by the nation's founders. Having such objective criteria for making decisions means Supreme Court justices cannot impose their own values or carry out personal

agendas, such as by throwing out laws passed by democratically elected representatives and potentially trampling the civil rights of minorities. For Originalists, the Supreme Court exists to protect the Constitution, and for the appointed justices to make rulings that add to, subtract from, or alter the intent of the nation's founders would be to undermine the role of the Constitution as the highest law of the land in the United States. With such diametrically opposing views guiding judicial review, it is easy to see how rulings regarding major issues facing society can be viewed as fair and exemplary by some, while being denounced as undemocratic meddling by others.

The Second Amendment is a case in point. Stating that "A well-regulated militia being necessary to the security of a free state, the right of the people to keep and bear arms shall not be

(38)

What do proponents of the "living Constitution" principle believe?

- 1 Supreme Court justices must understand that the language of the Constitution is too vague to be interpreted in a modern context.
- 2 The requirement for overwhelming political consensus should be dropped from the process for amending the Constitution.
- 3 Amendments that contain precise language should be made to the Constitution so that it will continue to be useful in the future.
- 4 The Constitution is a framework that requires judicial interpretation to address issues that leaders in the eighteenth century could not have predicted.

(39)

According to the Originalist interpretation of the Constitution,

- 1 following the intentions of the nation's founders too closely is dangerous because those intentions may conflict with modern ideas of civil rights.
- 2 Supreme Court justices being allowed to interfere with the Constitution creates a threat to the basic principles of American democracy.
- 3 although politicians are democratically elected, they should not try to amend the Constitution as it is wrong to make changes to the highest law of the land.
- 4 the exact words of the nation's founders should be directly referred to only when there is a conflict between democratically elected representatives and the Supreme Court.

infringed,” it was known as the “lost amendment” until the 1970s. When the amendment was passed in 1791, the American Revolution was still fresh in the minds of U.S. citizens. State militias were made up of part-time volunteer soldiers who supplied their own weapons, and it was felt that, had they been deprived of the right to bear arms, the United States would not have been able to achieve independence from Britain. But since, in modern times, such state militias have been largely replaced by a professional military, the amendment seemed to have little relevance to rulings made by the Supreme Court.

In the 1970s, however, a lobby group called the National Rifle Association, along with conservative politicians, began insisting the Second Amendment should be interpreted to mean that firearms were essential for protecting both oneself and

one’s freedoms. Originalist momentum grew, and in 2008, a landmark ruling, the *District of Columbia v. Heller* case, reversed decades of precedent and struck down a new law prohibiting people from keeping loaded handguns in their homes. *Heller* was a major triumph for the Originalists because the Supreme Court justices based their decision on the argument that the nation’s founders had intended the Second Amendment to refer to the individual’s right to own weapons, rather than just a state’s right to possess its own military forces. The ruling contains extensive discussions of the meaning of the specific language of the Second Amendment and what the nation’s founders had intended by it.

More recently, rulings such as the 2015 Supreme Court decision to legalize gay marriage have been seen as victories for proponents of the living Consti-

tution. The ruling is based on the Fourteenth Amendment, which says that no state could deny “the equal protection of the laws” to its citizens. However, it is almost certain that when it was passed in 1868, it was not meant to extend to homosexuals, whose behavior was generally considered sinful at the time. The modern Supreme Court, however, ruled that discriminating against same-sex couples was unconstitutional. Although people such as law professor Adam Winkler of the University of California, Los Angeles, have called this “one more nail in the coffin of Originalism,” shifts in judicial opinion happen regularly, as Supreme Court justices are appointed by political administrations with differing views on constitutional interpretation.

(40)

Why was the Second Amendment referred to as the “lost amendment” until the 1970s?

- 1 So few people insisted on the right to own weapons that there was a danger the courts would take it away.
- 2 The original text explaining the purpose of the amendment had been lost, so no one was sure exactly what it was intended to mean.
- 3 Since militias were no longer essential to national security, it was thought that the amendment did not apply to current legal issues.
- 4 The American Revolution had happened so long ago that citizens had come to oppose the states’ right to maintain militias.

(41)

The *District of Columbia v. Heller* court case

- 1 was the peak of an ongoing legal trend in which courts throughout the United States had been overturning gun-control laws.
- 2 had little effect on the Second Amendment’s interpretation because the case was so specific that it is unlikely to affect other gun-control-related issues.
- 3 was considered a defeat for believers in the living Constitution because the Supreme Court based its decision on the intent of the Constitution’s creators.
- 4 made it much harder for people to own weapons, not just in the District of Columbia but all over the United States.
