	(41)	4

4	Over a billion people worldwide do not get enough food to eat every day. Population growth, armed conflict, and Western eating habits are making it likely that the problem will only worsen.
	With the world's population at over 7 billion and rising, feeding everyone is an almost impossible challenge. Improvements in agriculture have failed to keep up with population growth. Moreover, the huge population is creating poverty, so people often cannot afford to buy enough food even when it is available.
	Additionally, wars are displacing millions of people every year, and famines almost inevitably result. Such conflicts disrupt every aspect of food production. Even after wars have ended, leftover landmines often make it impossible to farm.
	Western eating habits are also compounding the problem. Westerners consume huge amounts of meat. Such consumption has proven to be a highly inefficient way to get nourishment. An acre of land used for growing a crop such as wheat can feed far more people than an acre of land used to raise cattle. What is more, numerous crops are needed to feed these animals.
	Due to the burden caused by overpopulation, widespread conflict, and inefficient eating habits, it is hard to be optimistic about the future of the world's food supply.
