The Ikotoilet

People in developed countries have become used to the presence of clean toilets and bathrooms. In the developing world, however, the situation is very different. A good example is Kenya, where more than half of the population (**26**) access to toilets and clean water. One reason for this is the rapid growth of urban areas. As more and more poor people have moved from the countryside to cities, huge slums have developed. Homes in these very poor areas do not usually have any water or toilets.

David Kuria, a Kenyan architect, has come up with one solution to this problem: the Ikotoilet. It is a building that contains toilets, showers, and drinking fountains, all of which can be used for a very small amount of money. Besides being (**27**), the Ikotoilet has two other important features. The first is that it is designed to do minimum damage to the environment. The toilets use as little water as possible, and the waste produced is recycled as fertilizer. The second is that the Ikotoilets are designed to be fun, with music, a small shop selling refreshments, and other facilities. Kuria hopes that these things will make the Ikotoilets (**28**) places to visit.

So far, Ecotact, Kuria's company, has built 45 Ikotoilets around Kenya. Each one costs about \$20,000 to build and \$3,000 a year to run. The Ikotoilets not only provide a popular service but also give jobs to a total of 260 people. The real gain for Kenya, however, is much bigger. As in other developing countries, the shortage of clean water and toilets is one of the main causes of disease. Because of such disease, many children miss school, and many workers have to take time off. Preventing disease, (**29**), is important for a strong economy. Kuria is now planning to start building his Ikotoilets in many more African countries.

Holes in the Clouds

Have you ever had your flight delayed at an airport because of bad weather? If so, there may be a simple explanation. A recent study by a team of scientists has shown that at least some of the rain and snow that falls at airports is actually caused by airplanes taking off or landing. (**30**), the way this happens also explains the existence of strangely shaped holes in clouds that have puzzled scientists for decades.

The leader of the team, Andrew Heymsfield, got the idea for his research when he visited Denver International Airport, in the United States. While he was there, he noticed a narrow snowstorm that followed exactly the path of two airplanes that had taken off. He became sure that the airplanes had made the snow fall. In order to (**31**) this, the scientists in the team studied the effect of airplanes on clouds using satellite photographs, weather forecasts, and airport data. They discovered that when an airplane flies through a certain type of very cold cloud, it causes the temperature of the air in the cloud to drop further. This leads the water in the cloud to freeze and fall to the ground as snow or rain.

After the airplane has flown through the cloud, more and more of the cloud turns into rain or snow. This process continues for up to 90 minutes and leaves behind a large hole. Many scientists had noticed these holes in clouds before and wondered what made them. Now, we know the (**32**). According to Heymsfield, airplanes only affect clouds in this way under certain conditions. For this reason, the phenomenon probably does not lead to a dramatic increase in the amount of rain or snow that falls worldwide. Still, it has the result that airports are (**33**) than they would be otherwise.

From: Steve Lee <s-lee@synergonaappliances.com>
 To: Caroline Taylor <carolinetaylor@heathfieldadvertising.com>
 Date: June 8, 2012
 Subject: Advertising the Rendex 500

Dear Ms. Taylor,

I was given your e-mail address by Paul Jones, one of my co-workers here in the marketing department of Synergon Appliances. He said that your advertising agency created some newspaper advertisements for one of the microwave ovens that we make. I have recently joined the marketing department, and I would like to get your help making some advertisements for another product—the Rendex 500 refrigerator.

This refrigerator has been in stores since last November, but sales have been poor. I do not believe there is a problem with the product itself. According to customer surveys, most people who have bought the refrigerator are highly satisfied with it. Rather, it seems that our recent advertising has not been effective. Our advertisements have concentrated on the Rendex 500's reasonable price. They do not mention that it uses less electricity than many other refrigerators and so is better for the environment and costs less to run.

I want you to create newspaper advertisements that make these benefits clear. Could you come to the Synergon offices next week? I will go into more detail about what I want you to put in the advertisements, and we can discuss ideas for the design. Then perhaps you could make some samples I can show to my co-workers. Please let me know when you are free.

Yours sincerely,
 Steve Lee

- (34) Why is Steve Lee contacting Ms. Taylor?
- 1 She replied to his newspaper advertisement.
 - 2 Paul Jones used to work at her advertising agency.
 - 3 Her company made advertisements for Synergon Appliances before.
 - 4 He wants her to help him advertise a new type of microwave oven.
- (35) What does Steve Lee think is one reason for the Rendex 500's poor sales?
- 1 It costs more than many other refrigerators on the market.
 - 2 The current advertisements have not been seen by many people.
 - 3 People do not know that it can help them save money on electricity.
 - 4 The company has not done enough surveys to get customers' opinions.
- (36) What is one thing Steve Lee wants Ms. Taylor to do?
- 1 Create some examples of advertisements based on his requirements.
 - 2 Come up with some ideas about which newspapers to advertise in.
 - 3 Discuss the advertisements at a meeting with his co-workers.
 - 4 Take a look at the design ideas he is sending with the e-mail.

Smoother Sailing

In recent years, there has been huge growth in global trade. This, in turn, has led to a dramatic increase in the number of ships being used to carry goods. These ships consume an enormous amount of fuel. This not only costs a great deal of money but also results in a lot of carbon dioxide being released into the atmosphere. As a result, the shipping industry is searching hard for ways to reduce the amount of fuel it uses.

Since most of the fuel is used to move the ship through the water, one good way to reduce fuel costs is to make it easier for the ship to travel through the water. One solution is to use bubbles of air. Recently, some new ships have been built with an “air-bubble system.” In this new system, the bottom of the ship has small holes in it, and a pump pushes air through the holes. This creates bubbles that join together to form a layer. The layer of air helps the ship to go forward more smoothly, so it needs less fuel.

At first, one problem with this system was that the bubbles tended to escape easily. However, by creating thin barriers on both sides underneath the ship, it became possible to trap the air for longer. Although the pump used to push the air out also needs fuel, much more fuel is saved overall. With the barriers, the system can reduce the amount of fuel used by as much as 15 percent.

Despite these impressive savings, very few shipping companies adopted air-bubble systems until recently. This was because it costs a great deal of money to build a new ship, and companies try to use their existing ships for as long as possible. Now, a Dutch company called the DK Group has solved this problem. It has created an air-bubble kit that can be fitted to an existing ship in just two weeks. With growing pressure on the shipping industry to produce less carbon dioxide, it seems likely that many companies will invest in these kits.

(37) What is one problem facing the shipping industry?

- 1** The ocean has become increasingly crowded.
 - 2** It has to spend a lot of money on fuel.
 - 3** There are not enough goods being traded.
 - 4** Carbon dioxide has been affecting ships' engines.
-

(38) How does the air-bubble system work?

- 1** It helps water to flow through holes in the ship's bottom.
 - 2** It saves fuel by mixing it with water from the sea.
 - 3** It uses a pump to remove air from the ship's fuel.
 - 4** It creates a layer of air on the bottom of the ship.
-

(39) In the air-bubble system,

- 1** barriers under the ship help stop air bubbles from escaping.
 - 2** the fuel that is saved can be used to produce electricity.
 - 3** bubbles can keep the ship's bottom in good condition.
 - 4** the pump can prevent the ship from moving too quickly.
-

(40) Why did few companies start using air-bubble systems until recently?

- 1** The systems would make ships produce too much carbon dioxide.
- 2** The people who work on the ships need training to use the systems.
- 3** It was necessary to build new ships to use them.
- 4** It took too long to install the systems on existing ships.

Africa's Great Green Wall

The Sahara Desert, in Africa, is the world's largest hot desert, and it is getting bigger all the time. Researchers say that, partly because of global warming, the desert is now spreading southward by up to about 50 kilometers a year. This has made life very hard for people in the countries that are directly south of the Sahara. Now, however, a major plan to stop the desert's growth is about to be put into practice.

This plan is known as the Great Green Wall, and it involves the creation of a "wall" of trees 15 kilometers wide and almost 8,000 kilometers long. The Great Green Wall is intended to reduce damage from the sandstorms blowing off the Sahara and to help keep the soil stable and fertile. Its trees will provide local people with wood and other materials, and it will become a home for plants and animals. The trees will also help to remove carbon dioxide from the air. Eleven different countries across Africa have agreed to participate in the project.

The idea itself is not a new one. In fact, it was first suggested in the 1980s. The problem has been a shortage of money. This all changed in 2011, when a group of international organizations, including the Global Environment Facility (GEF), agreed to donate up to \$3 billion to the project. A number of NGOs representing local communities, however, are concerned about the plan's possible effects. They are especially worried about the idea of planting a large number of trees. They say this might mean introducing new kinds of trees from other areas that would damage local ecosystems and use up valuable farmland.

The GEF, however, says that these fears are unnecessary. They say that they are not just planning to have trees planted across Africa. Rather, they will require each country to consult with local citizens and come up with a plan that will improve people's lives without harming the environment. As the GEF points out, simply planting trees will not work unless local people have some reason to look after them. By choosing trees that offer a source of income, such as fruit trees, the GEF believes that the Great Green Wall will continue to help people long after it has been completed.

(41) What problem are some African countries having?

- 1 Plans to improve the environment are not working.
- 2 Their land is being taken over by the Sahara Desert.
- 3 Researchers cannot get enough money to study there.
- 4 Many people have to move because of the increased heat.

(42) The Great Green Wall will

- 1 make it harder to travel between some countries.
- 2 benefit plants and animals as well as humans.
- 3 require a lot of wood and other materials to build.
- 4 reduce the number of sandstorms inside the Sahara Desert.

(43) Why did it take a long time to start the Great Green Wall project?

- 1 Local communities did not want any more trees.
- 2 Nobody could find trees that were suitable for the wall.
- 3 There was not enough money available to plant the trees.
- 4 Some people were worried that the trees would create carbon dioxide.

(44) What is one reason the GEF thinks the Great Green Wall will be a success?

- 1 The same kinds of trees can be planted in every country.
- 2 The trees will help people living nearby to make more money.
- 3 The organization will be responsible for looking after the trees.
- 4 The plan has been approved by NGOs representing local people.

(45) Which of the following statements is true?

- 1 Some of the trees that the GEF planted in the 1980s are still growing in Africa.
- 2 The purpose of the Great Green Wall is to provide wood for new buildings.
- 3 Some people worry that trees from outside the local area will cause problems.
- 4 The Great Green Wall project was started by NGOs representing local communities.
