Music to My Ears

Music plays an important role in people's lives around the world. Singing, as it does not require any special tools or instruments, is a particularly popular way for people to enjoy music. Although many people sing for fun, few people know that singing actually (**21**). From helping people fight diseases to reducing stress, singing can make people's lives better.

Singing can also be seen as a type of exercise. When people sing, their bodies use a number of important muscles. It also helps people improve their breathing and strengthens both their lungs and hearts in the same way as aerobic exercise such as jogging. (**22**), some experts say that singing can actually be a good alternative to exercise for elderly people who need to improve their weak lungs and hearts. Furthermore, singing increases the chemicals in the body that make people feel good, which can help reduce anxiety and depression.

New research has shown that singing (**23**) can also have positive effects. Don Stewart, a researcher at Griffith University in Australia, surveyed elderly members of a chorus. He found that although they had the same health problems as other elderly people, they were actually happier than those who did not sing or those who sang alone. In addition, the chorus members visited the doctor less and took fewer medicines. After noticing these advantages, some governments are considering promoting choruses as a way to reduce the cost of medical care for the elderly.

Washing Away

Most people have heard about the large number of plastic bottles and bags that are floating around in the world's oceans, harming fish and other animals. Mark Browne, an environmental researcher, examined the types of plastic that had washed up on various beaches around the world. He was surprised to find large amounts of plastic, such as polyester and acrylic, which are not used to make plastic bottles or bags. From this, he knew that this plastic waste must be (24).

Since polyester and acrylic are found in many types of clothing, Browne thought that small plastic fibers were probably being washed off people's clothes and flowing through the sewer system* to the ocean. Wanting to solve this problem, Browne talked to a number of clothing companies. He recommended that they make clothes that were stronger and less likely to lose plastic fibers. However, many of these companies (25) was the problem. Instead, they said that these plastics could be coming from many other things, such as blankets, rugs, or even paint.

Unwilling to give up, Browne found an engineer named Blair Jollimore. Jollimore had noticed that plastic fibers from his washing machine had been causing a problem with his water pipes at home. He was able to solve this problem by inventing a device that stops the plastic from leaving his washing machine. Browne encouraged Jollimore to sell this invention to large companies so that they could reduce the amount of plastic waste getting into the sewer system. (26), Browne hopes that the amount of plastic waste in the ocean will eventually decrease.

From: John Holter <j-holter@housemail.com>
 To: Sara Mylan <smylan11@mymail.com>
 Date: June 12
 Subject: Used car

Dear Ms. Mylan,
 My name is John Holter, and I saw your advertisement on the Internet. I am interested in buying the used car that you are selling. My son's 18th birthday is in a few weeks, and my wife and I are thinking about buying him his first car as a present. If your car is still available, I would like to ask you a few questions about it. Your advertisement says that the car is a 2006 model and that it has been driven for 100,000 kilometers. Are you the first owner of the car, or was it already used when you bought it? Also, how often have you been changing the oil? Has the car ever had any trouble such as engine problems? I would also like to know how new the tires are, and if the car has ever been in an accident.
 It would be great if you could answer my questions by e-mail by Thursday. Then, perhaps I can call you to talk about some other details and arrange a day next week when my wife and I could come to look at the car. We both work during the day but are usually free after 6 p.m.
 Sincerely,
 John Holter

- (27) John Holter's son
- 1 put an advertisement on the Internet for a used car.
 - 2 wants to buy his first car sometime soon.
 - 3 is going to turn 18 years old in a few weeks.
 - 4 is shopping for a present for his mother and father.
-
- (28) What is one thing John Holter asks Ms. Mylan about her car?
- 1 Whether or not it was new when she bought it.
 - 2 How many kilometers it has been driven for.
 - 3 If she knows a good place to have its oil changed.
 - 4 What model of car it is and when it was made.
-
- (29) What does John Holter want Ms. Mylan to do by next Thursday?
- 1 Call him on the phone to tell him about the car.
 - 2 Bring the car to his house so he can look at it.
 - 3 Send him an e-mail with answers to his questions.
 - 4 Tell him her work schedule so that they can meet.

Snake Hearts

Many large snakes eat as rarely as once every three months. When they do eat, however, they eat whole animals, such as deer or wild pigs. In order to digest these large meals, the heart and other organs inside the snake's body suddenly grow much larger. The heart, for example, does this so that it can pump blood around the body much faster. This allows the snake to digest food more quickly. After the snake has digested the meal, the organs go back to their usual size.

One snake that does this is the Burmese python. American biologist Leslie Leinwand and her team at the University of Colorado Boulder decided to research exactly how the Burmese python manages to expand its heart so dramatically. The team found that certain chemicals in the snake's blood cause the heart to grow. When the team added the snake's blood to cells taken from mice's hearts, they were surprised to find that the cells also began to grow.

After further experiments, Leinwand removed the chemicals from the snake's blood and gave them to living mice. As a result, the mice's hearts grew dramatically. Leinwand believes that her research may be able to help humans with heart diseases. Human hearts grow larger in two ways, one unhealthy and one healthy. When people have high blood pressure, for example, the muscles in their hearts grow to help the heart push blood around the body. This kind of growth actually damages the heart and makes it weaker. On the other hand, when people do exercise, their hearts grow larger in a healthy way.

According to Leinwand's research, the chemicals in the snake's blood cause the heart to grow in the same way that exercise usually does. She believes that if she could make a drug from these chemicals, it could cure certain heart diseases in humans. She says that more research is needed and that it will be years before a drug could be developed. However, she believes that the discovery is very exciting because it shows that the chemicals taken from one creature can affect the heart of a completely different creature.

(30)

Many large snakes change the size of their hearts in order to

- 1 make more space for the whole animals that they eat.
- 2 better digest the blood of the animals that they eat.
- 3 be able to catch more food more quickly.
- 4 help them digest large meals more quickly.

(31)

What is one thing that Leslie Leinwand's team learned about Burmese python blood?

- 1 It has the effect of making mice's heart cells grow larger.
- 2 It can be used to increase the size of farm animals.
- 3 It expands dramatically when added to the blood of other animals.
- 4 It reduces the size of mice's hearts while the mice are sleeping.

(32)

What happens to the heart of a person with high blood pressure?

- 1 It becomes able to produce more blood to pump around the body.
- 2 It becomes weak and damaged as a result of becoming bigger.
- 3 It has to be supported by various muscles in the body.
- 4 It has to be given a special medicine to help it grow.

(33)

Leinwand believes that

- 1 humans should drink snake blood in order to live a healthy life.
- 2 the drug she makes will benefit snakes and other wild animals.
- 3 her research can be used to develop medicine for some heart diseases.
- 4 Burmese pythons can protect humans from diseases spread by mice.

The Handwriting Debate

The development of computers has had a huge effect on society. As a result, many schools around the world have introduced computer classes, and some encourage students to use computers in other classes, too. This not only allows students to take notes and complete assignments more quickly but also helps them gain the skills they need for jobs they will do in the future. However, the new focus on computer skills means that many schools in developed countries are spending much less time teaching students how to write by hand.

Surveys show that many parents are concerned about the fact that their children spend so little time developing good handwriting skills. In the past, learning good handwriting was considered a necessary part of a good education, and these parents feel children are losing an important skill. However, some education experts say such parents are too focused on the past. The world has changed, they say, and typing is now more important than writing by hand.

On the other hand, recent research has shown that writing by hand may help people learn more quickly. Karin James, a psychologist at Indiana University in the United States, studied the brains of children when they were writing letters by hand and when they were typing. She found that children who wrote letters by hand used an additional three parts of the brain that children who were typing did not. Virginia Berninger, a psychologist at the University of Washington, also found that the brain was more active when writing by hand than when using a keyboard. Even more importantly, she found that when children wrote by hand, they used a wider range of vocabulary and expressed more complex ideas.

Handwriting is also important because it increases the hand's strength and flexibility. In particular, it strengthens the small muscles in the hand and allows people to make very accurate, small movements. This can be very important in certain jobs, such as for doctors who perform operations. All this research suggests that schools should think again before focusing entirely on having children use computer keyboards to write.

(34)

Why do some schools encourage students to use computers?

- 1 It takes students less time to learn how to type than it does to learn how to write.
- 2 It allows teachers to spend less time working with students in their classes.
- 3 It helps students perform tasks in class faster and prepares them for future jobs.
- 4 It helps students learn by connecting them with other students around the world.

(35)

Many parents are worried about their children because they

- 1 believe that their children are not learning an important skill.
- 2 think that the world is changing and their children need computer skills.
- 3 are not able to teach their children how to use computers at home.
- 4 feel that spending so much time studying will harm their children's eyes.

(36)

Karin James found that

- 1 a combination of writing and typing is the best way to help children learn.
- 2 the brain has a hard time handling information when a person is writing.
- 3 children who are typing use fewer parts of the brain than children who are writing by hand.
- 4 most people prefer to write letters to their children by computer rather than by hand.

(37)

How can learning handwriting help doctors?

- 1 It encourages them to focus more on their patients when performing operations.
- 2 It gives them stronger muscles which help them carry heavy medical equipment.
- 3 It helps them do their job better by allowing them to see small movements more easily.
- 4 It improves their ability to move their hands accurately while performing surgeries.

(38)

Which of the following statements is true?

- 1 Typing helps students come up with more ideas and organize them better.
- 2 Children use a larger variety of words when writing by hand.
- 3 Good handwriting has recently become an important skill.
- 4 Teachers spend a lot of time preparing for classes that teach typing.
